Throughout the long history of development of the Earth, the natural and geographical environment is the only space for humanity. From the period of human evolution, their interaction is continuous and reversible. At the current level of development, man has used a significant part of geographical environment and has a important impact on it and at the same time, the natural environment leads to the development and trends of human development. In this regard, perhaps one of the most important is climate and its current state, history of past climate changes and future forecast. Climate change on earth is constantly ongoing, and now days we have a global warming trend, which was followed by the medieval period of XIII-XIX. So-called "little ice age" period. It is true that a small ice age is not a period of classical glaciation, but this period was the most important geographical and climatic phenomenon for the last stage of human development, which has influenced and changed the trends of life and development of the social community in many areas. Approximately 2 C⁰ Decrease Earth global average temperatures have a significant impact on food resources, its distribution. The lack of food was accompanied by a wide variety of diseases, Population epidemic morbidity, general hunger. With the aim of capturing more resources on this background, waging wars and strengthening the desire to conquer new territories from different states. Strong rituals and religious issues related to weather and food from the church. The changes in the small period of \approx 3-4 century changed radically and influenced the future trends of human development. All this showed how fragile the society is concerned about such changes. Based on this, it is important to study the historical and geographical perspective of a small ice age period as far as the past experience may become the cornerstone of society's future development.
